GitOps basics

Origin: blog post by Weaveworks, August 2017

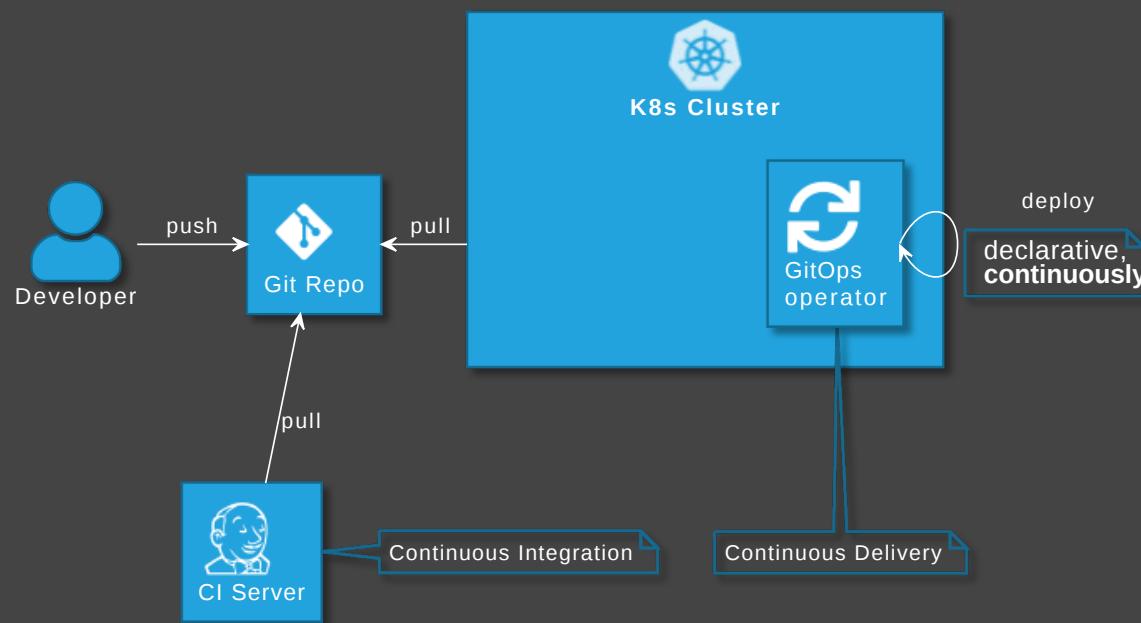

Use developer tooling to drive operations

 weave.works/blog/gitops-operations-by-pull-request

"Classic" Continuous Delivery ("CIOps")

GitOps

GitOps Principles

The desired state of a GitOps managed system must be:

- 1 Declarative**
- 2 Versioned and Immutable**
- 3 Pulled Automatically**
- 4 Continuously Reconciled**

 github.com/open-gitops/documents/blob/main/PRINCIPLES.md

GitOps vs DevOps

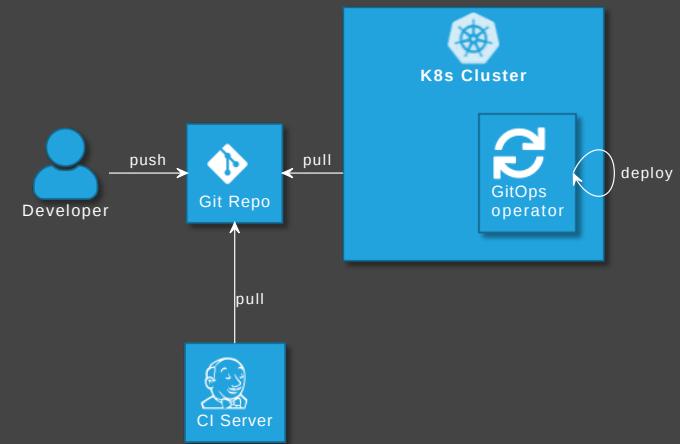

- DevOps is about collaboration of formerly separate groups (mindset)
- GitOps focuses on ops (operating model)
- GitOps could be used with or without DevOps and vice versa
- Still, GitOps might be...

The right way to do DevOps

 Alexis Richardson

Advantages of GitOps

- No access to cluster from outside
(might also solve firewall/zone issues)
- No credentials on CI server
(neither cluster access nor for apps)
- Forces declarative description
- IaC is auditable
- Scalability - one repo many applications
- Self-healing

What can GitOps be used for?

GitOps tools

GitOps tool categories

- GitOps operators/controllers
- Supplementary GitOps tools
- Tools for operating cloud infra

GitOps operators/controllers

Supplementary GitOps tools

- Secrets
 - KMS, e.g.    ...
 - + K8s Integration
 - Operator
 - Container Storage Interface (CSI) driver
 - Side car (injector)
 - Helm/Kustomize plugin
 - GitOps Operator: native support or plugin
- Backup / **restore**
- Deployment Strategies - Progressive Delivery

- ...

GitOps ❤ operators

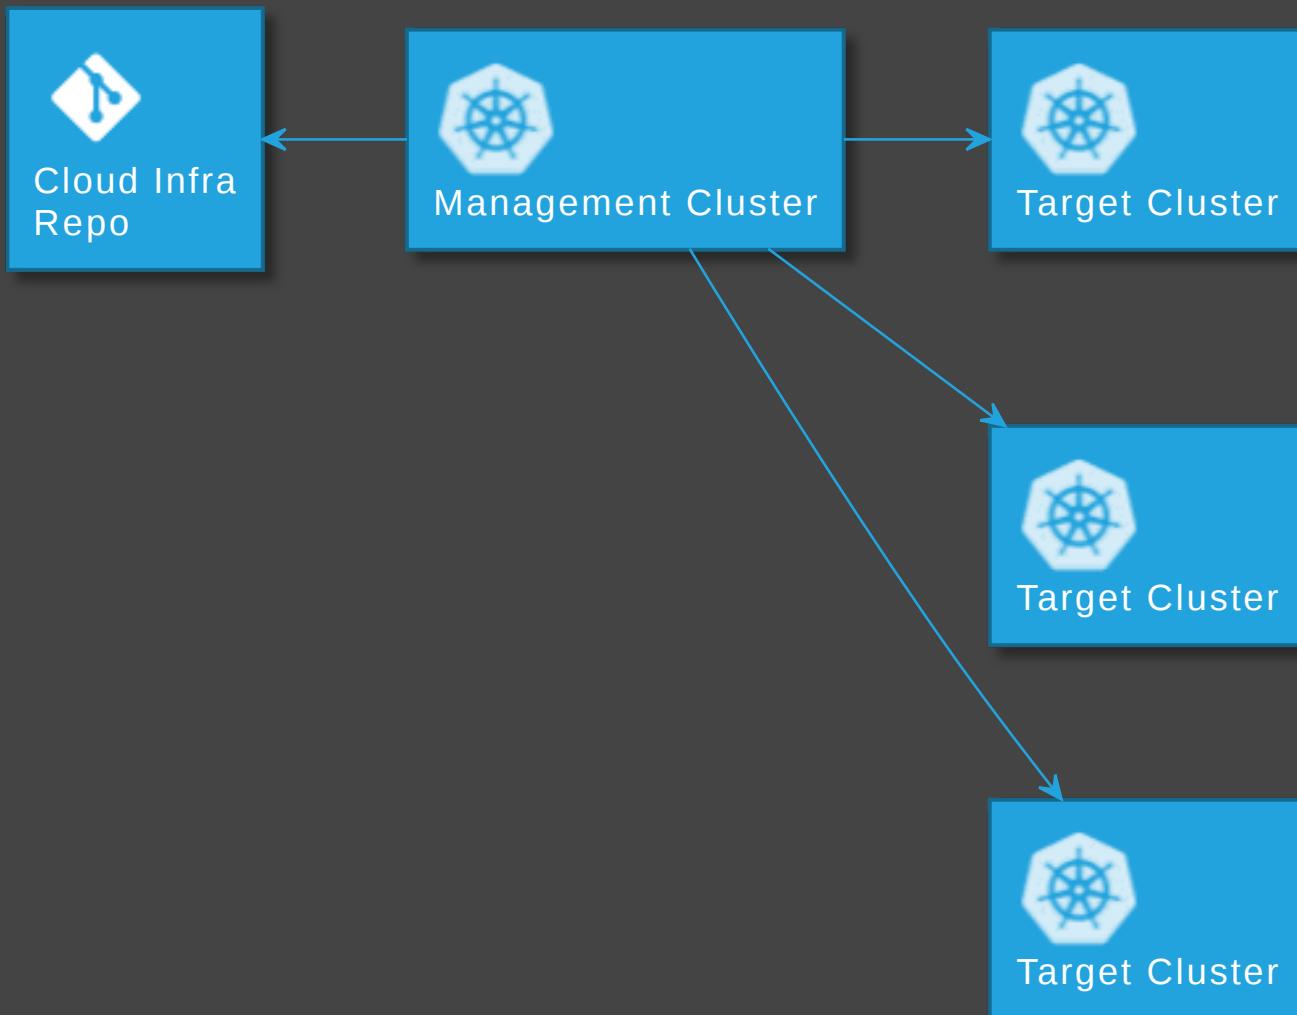

+

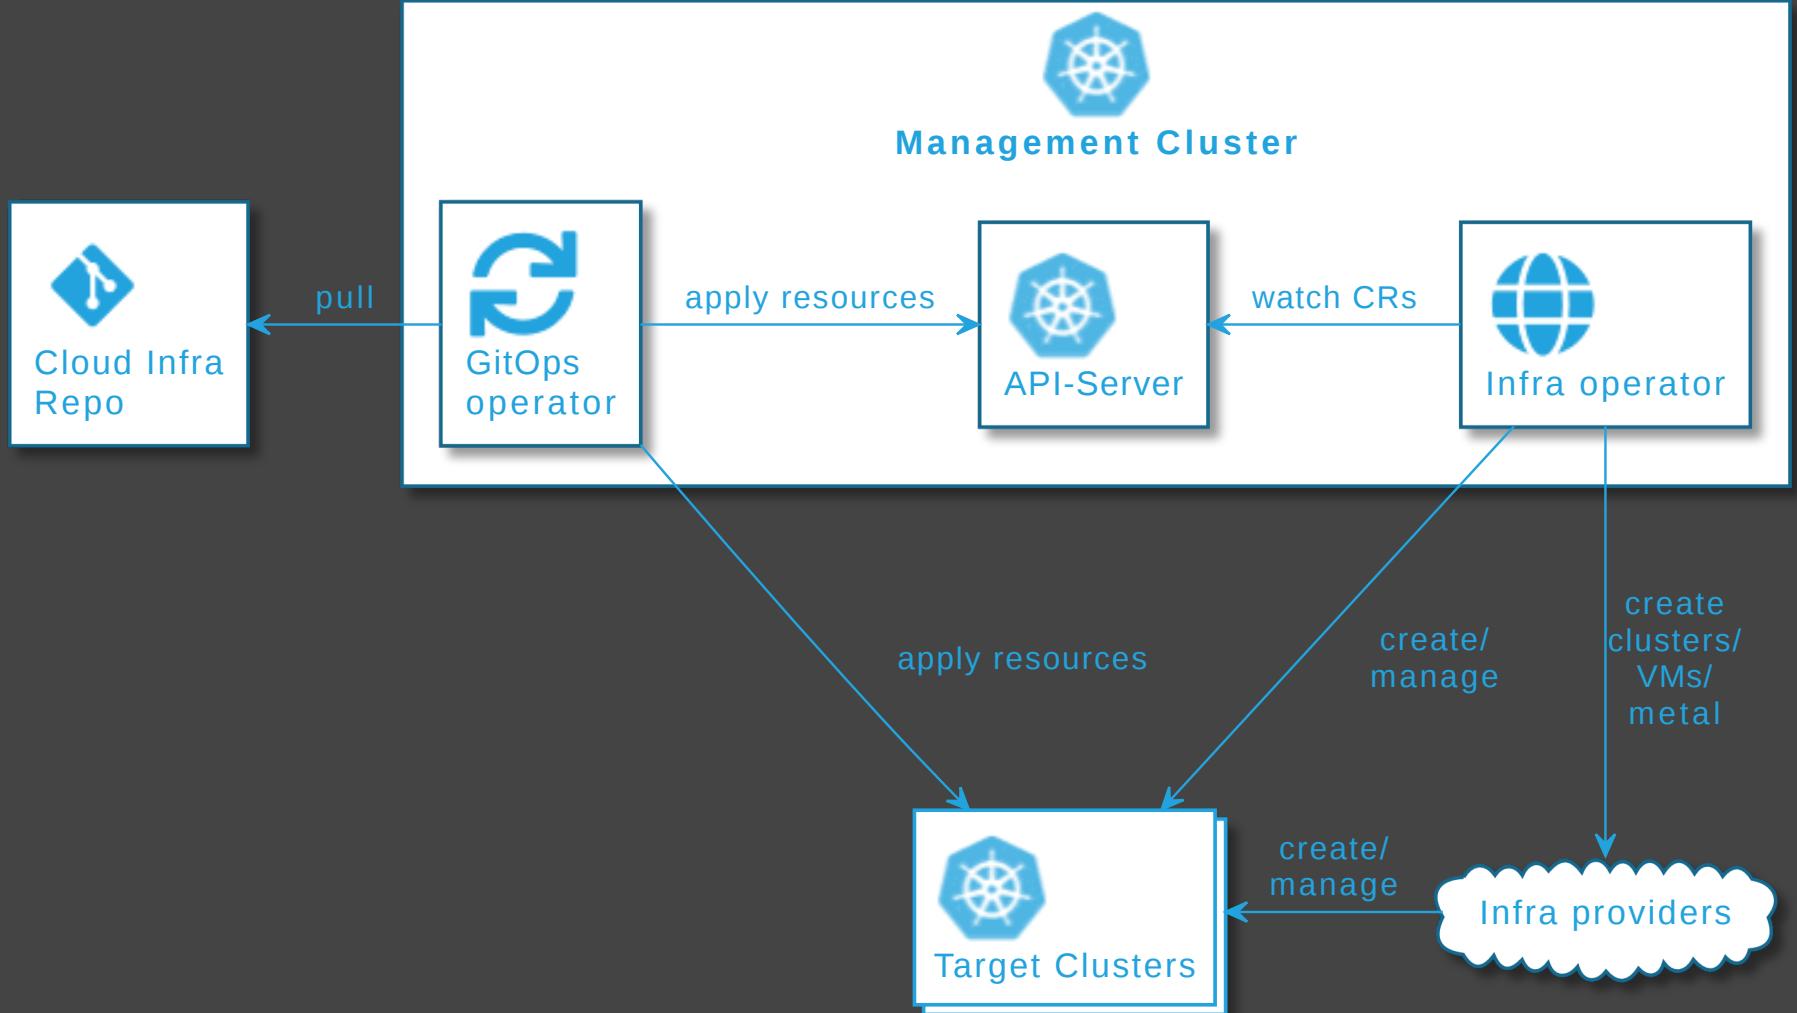

Infra Operator

=

Operate cloud infra with GitOps

Operate Kubernetes with Kubernetes

Challenges with GitOps

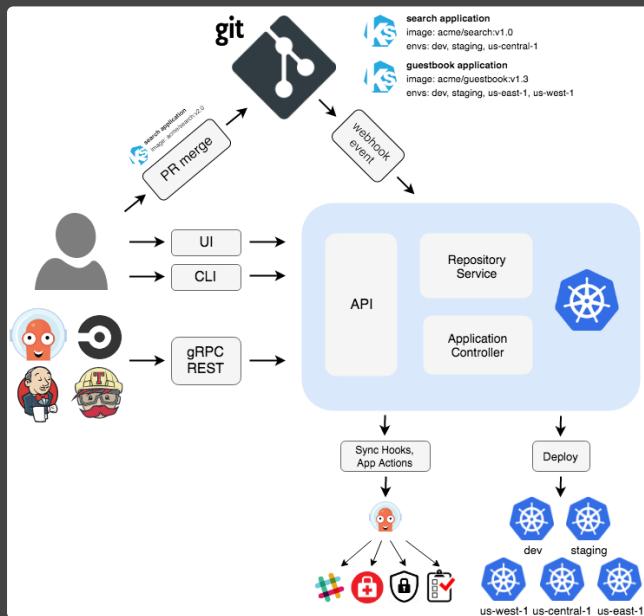

Downsides

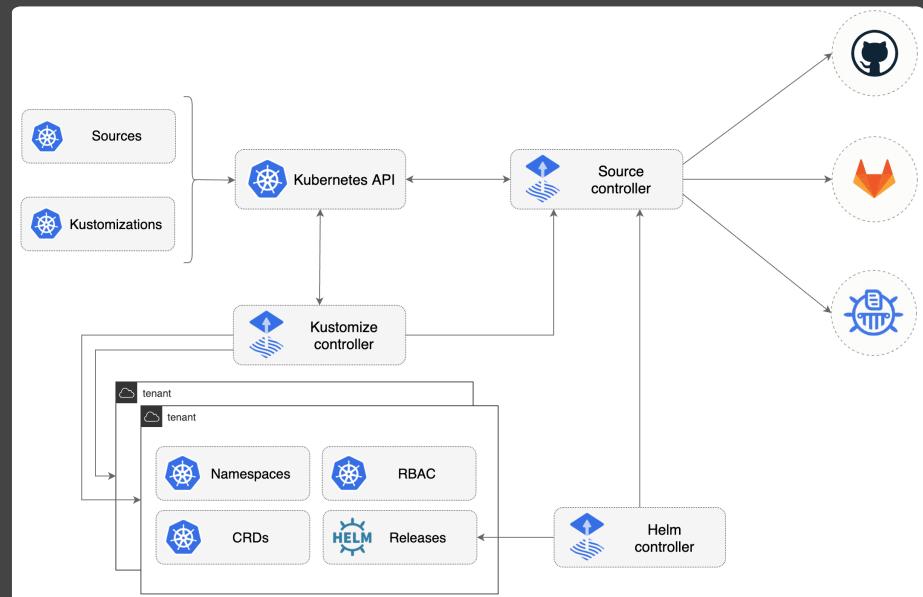

- More infra necessary
- Steep learning curve

GitOps infra

- GitOps Operator comprises several applications
- Cause ops efforts: maintenance, alerts

argo-cd.readthedocs.io/en/stable/assets/argocd_architecture.png

fluxcd.io/img/diagrams/gitops-toolkit.png

Learning curve

- New concepts and tools for developers and platform teams
- Adapt deployment process
- Migrate applications
- Adapt error handling and alerting
 - avoid failing late and silently
 - accustom to new notification mechanism
 - still, reason might be difficult to pinpoint

Day two questions

- How to realize local dev env?
- How to delete resources?
- How to structure repos and folders?
- How to realize different stages/environments?
- Role of CI server?
- ...

Local development

- Option 1: Deploy GitOps operator and Git server on local cluster
 - complicated
- Option 2: Just carry on without GitOps.

How to delete resources?

- garbage collection (Flux) / resource pruning (ArgoCD)
disabled by default
- 💡 Enable from beginning ➡️ avoid manual interaction
- Unfortunately, still often unreliable / too defensive (?) 😞

Repo and folder structure

- No standard for structures (intentionally) → Conway's law
- Repo patterns: Monorepo vs Polyrepo (per app, team, stage) 🏢
- Within repo: folder/~~branch~~ structure for stage, team, app
- More options:
 - Topology: GitOps controller (s) ↔ Cluster(s) / Namespaces
 - GitOps controller-specific config

💩 GitOps Chasm

🌐 🐙 🚧 Infra

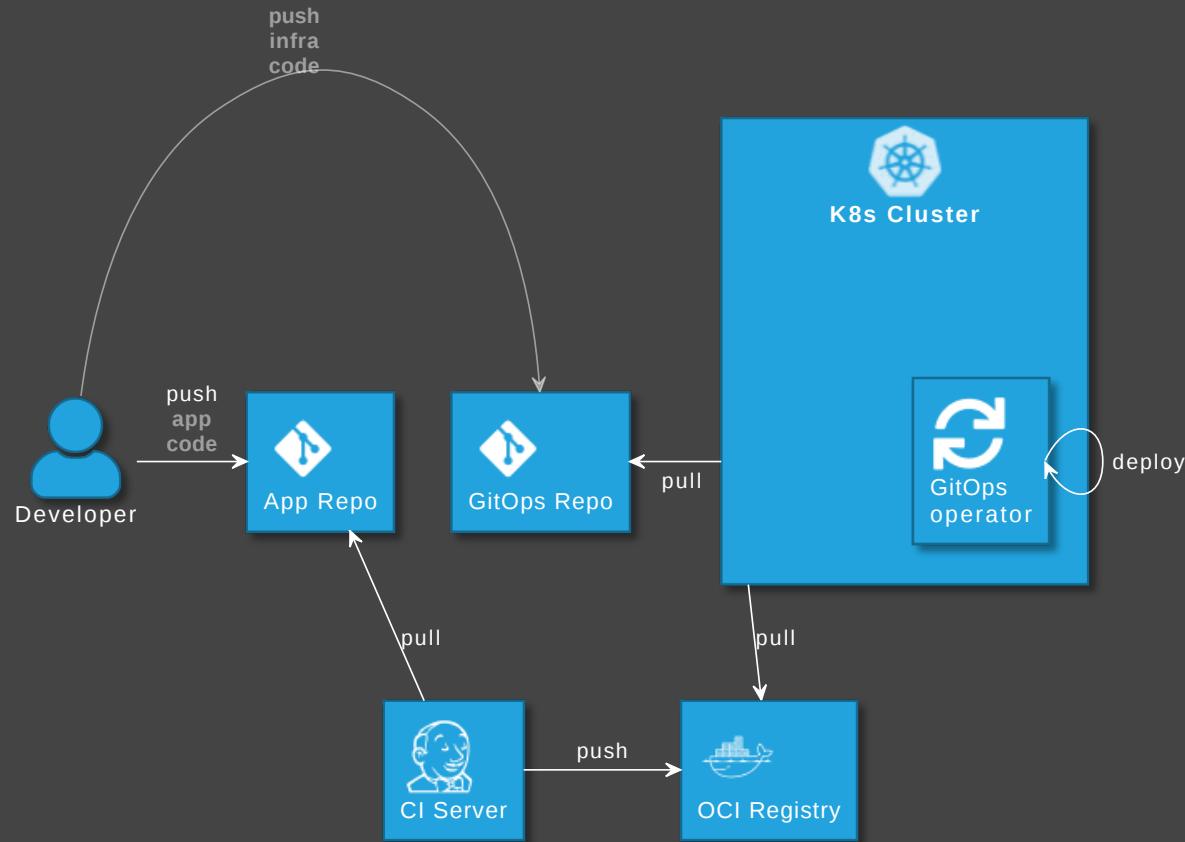

- repos
- folders
- branches
- clusters
- namespaces
- controller instances
- controller-specific config

↔
Mapping?
🤔

🌐 Real-world

- company/departments
- teams
- projects
- applications
- microservices
- stages/environments
- customers
- tenants
- etc.

App repo vs GitOps repo

GitOps tools: Put infra in separate repo! See

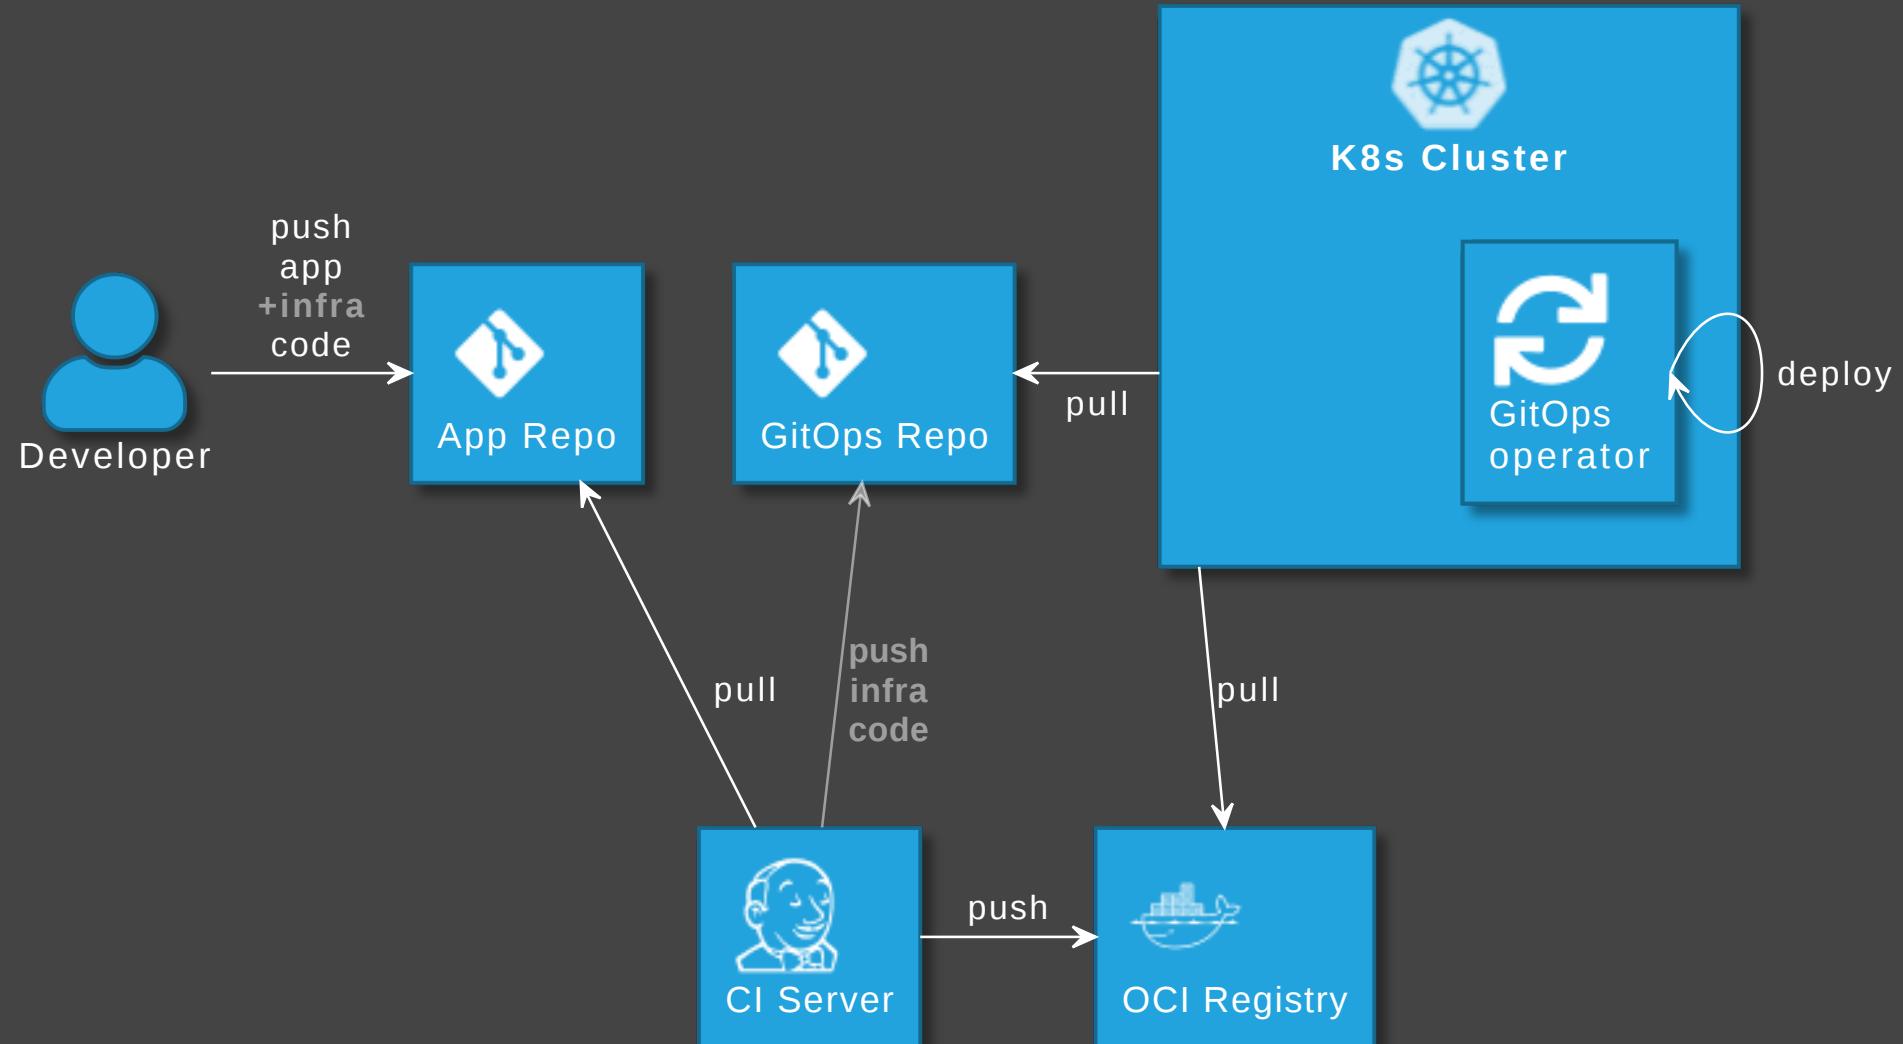

argo-cd.readthedocs.io/en/release-2.5/user-guide/best_practices

Disadvantages

- Separated maintenance & versioning of app and infra code
- Review spans across multiple repos
- Local dev more difficult
- Static code analysis for IaC code not possible

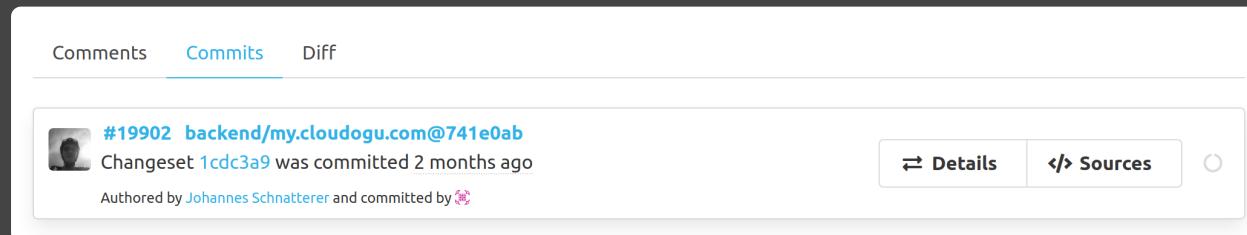

How to avoid those?

Using CI-Server with GitOps part 1

Advantages

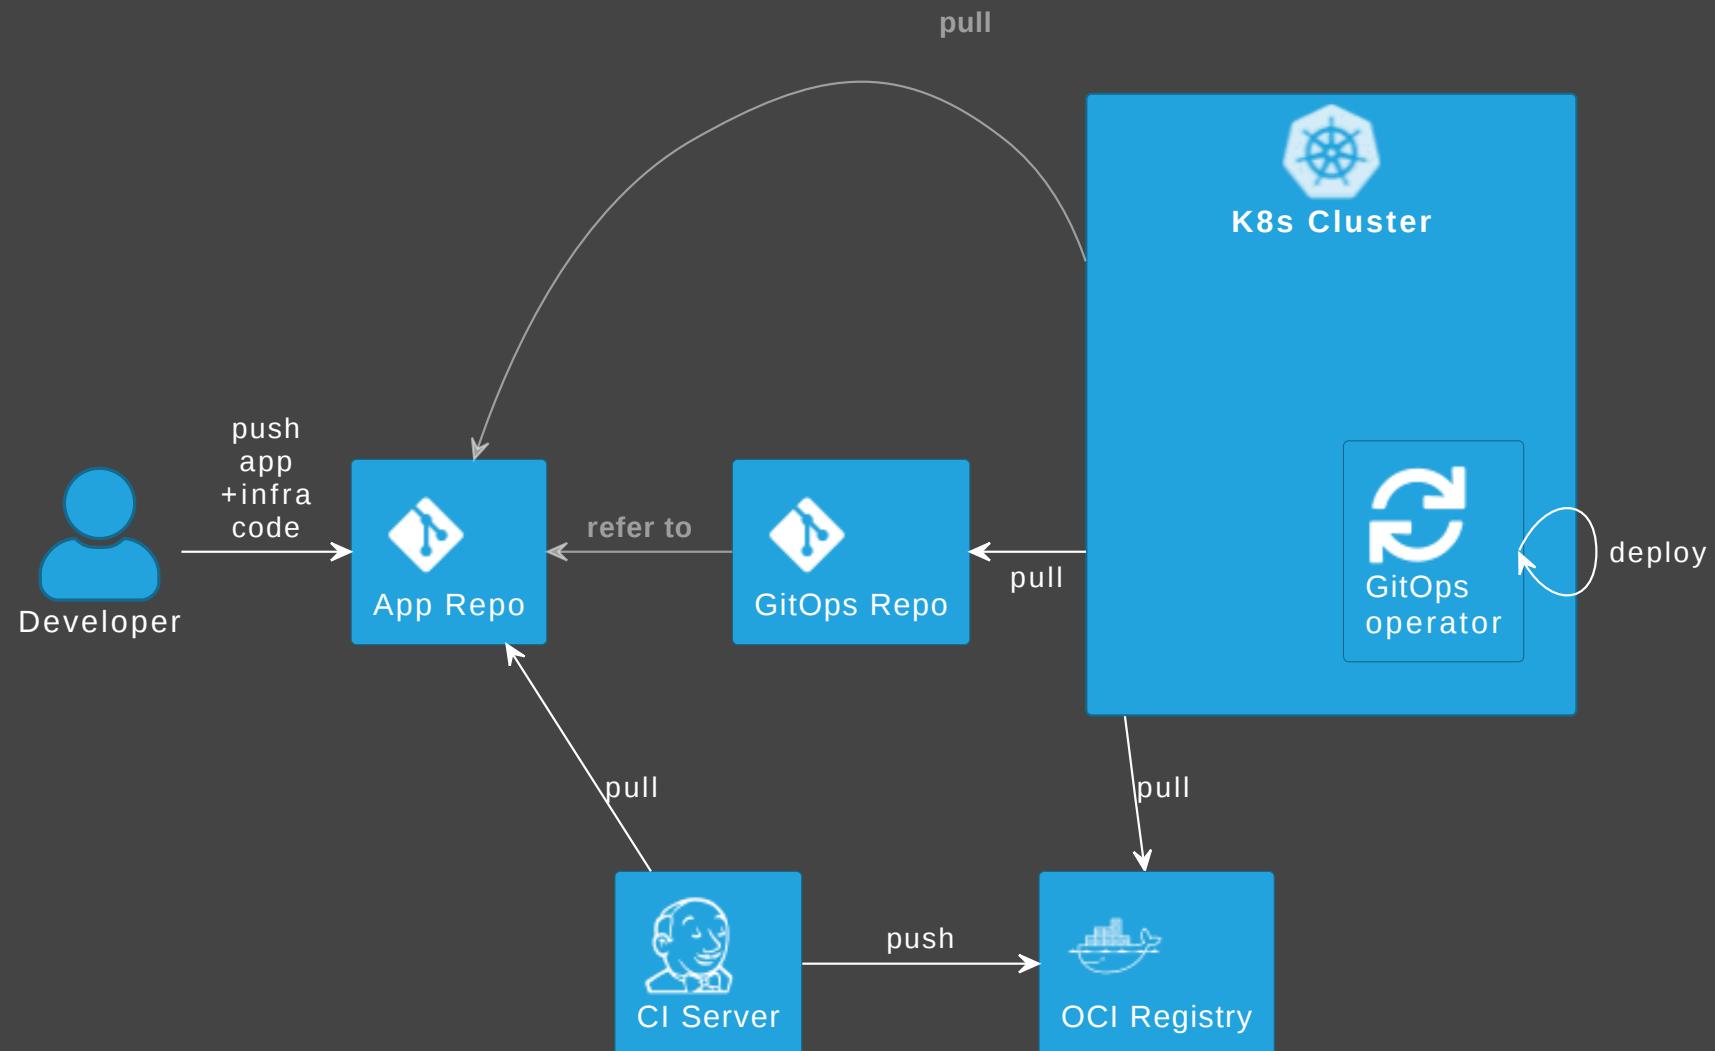

- Single repo for development: higher efficiency
- Shift left: static code analysis + policy check on CI server, e.g. yamlint, kubeval, helm lint, conftest
- Automated staging (e.g. PR creation, namespaces)
- Simplify review by adding info to PRs

Disadvantages

- Complexity in CI pipelines
 - ➡ Recommendation: Use a plugin or library, e.g.  [cloudogu/gitops-build-lib](#) 
- Redundant code

Alternative: Refer to app repo

Stage promotion

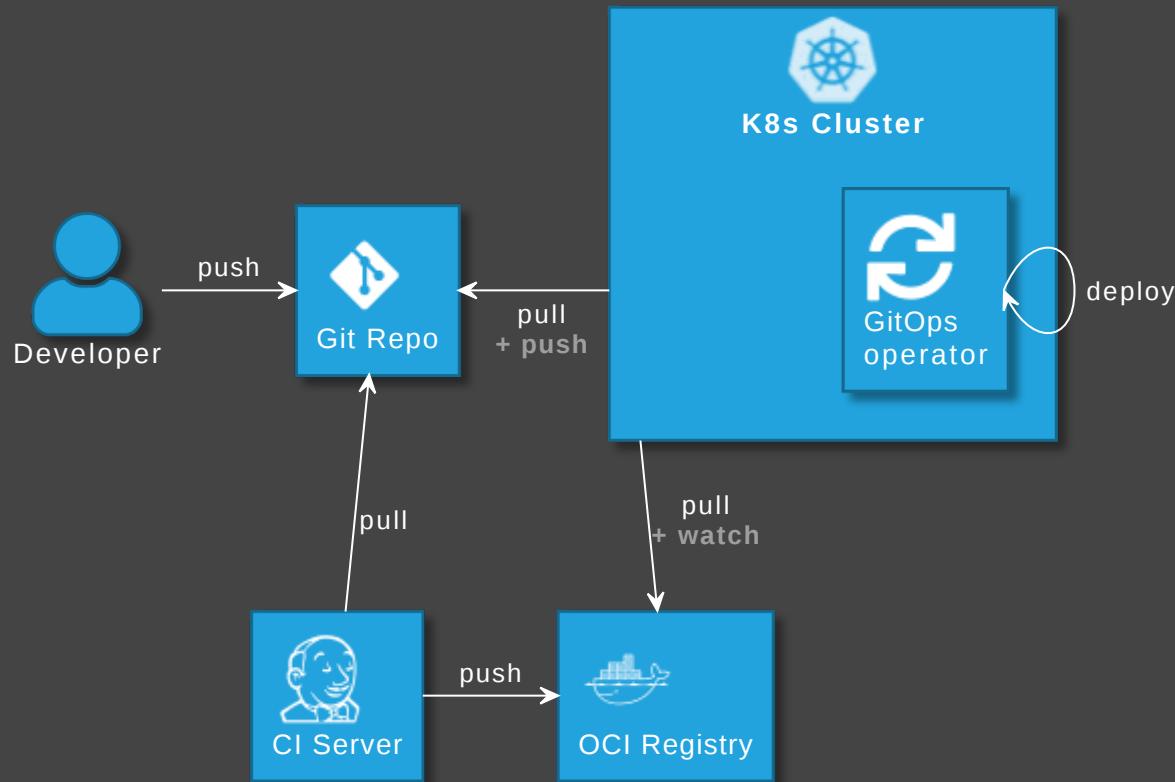

- “GitOps - Operations by Pull Request”
- Repo structure: Use folders not branches
- But: create *short-lived* branches and PR
- Merge is promotion

Implementing stage promotion

Who bumps versions in GitOps repo, creates branch and PR?

- **Manual:** Human pushes branch and create PR
- **Image Updater:** Operator pushes branch, create PR manually
- **CI Server:** Build job pushes branch, creates PR
- **Renovate Bot:** Bot pushes branch, creates PR

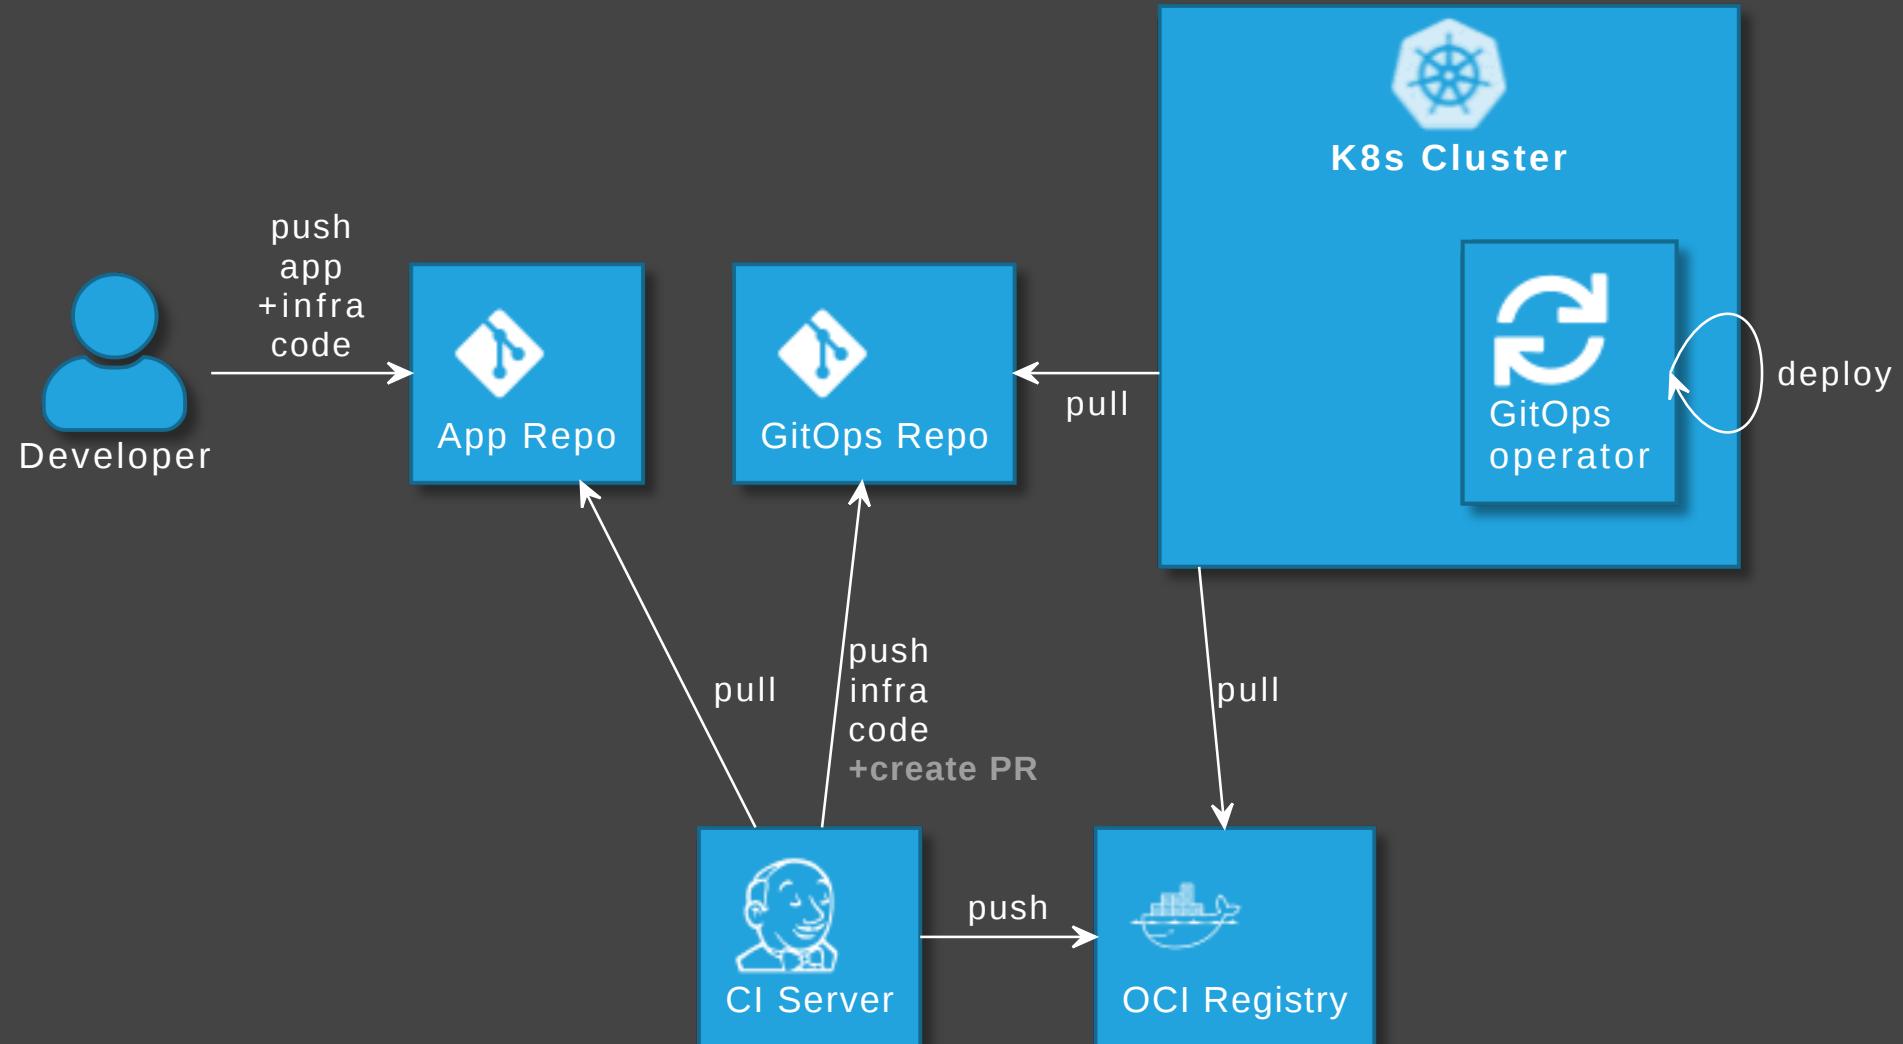

Image updater

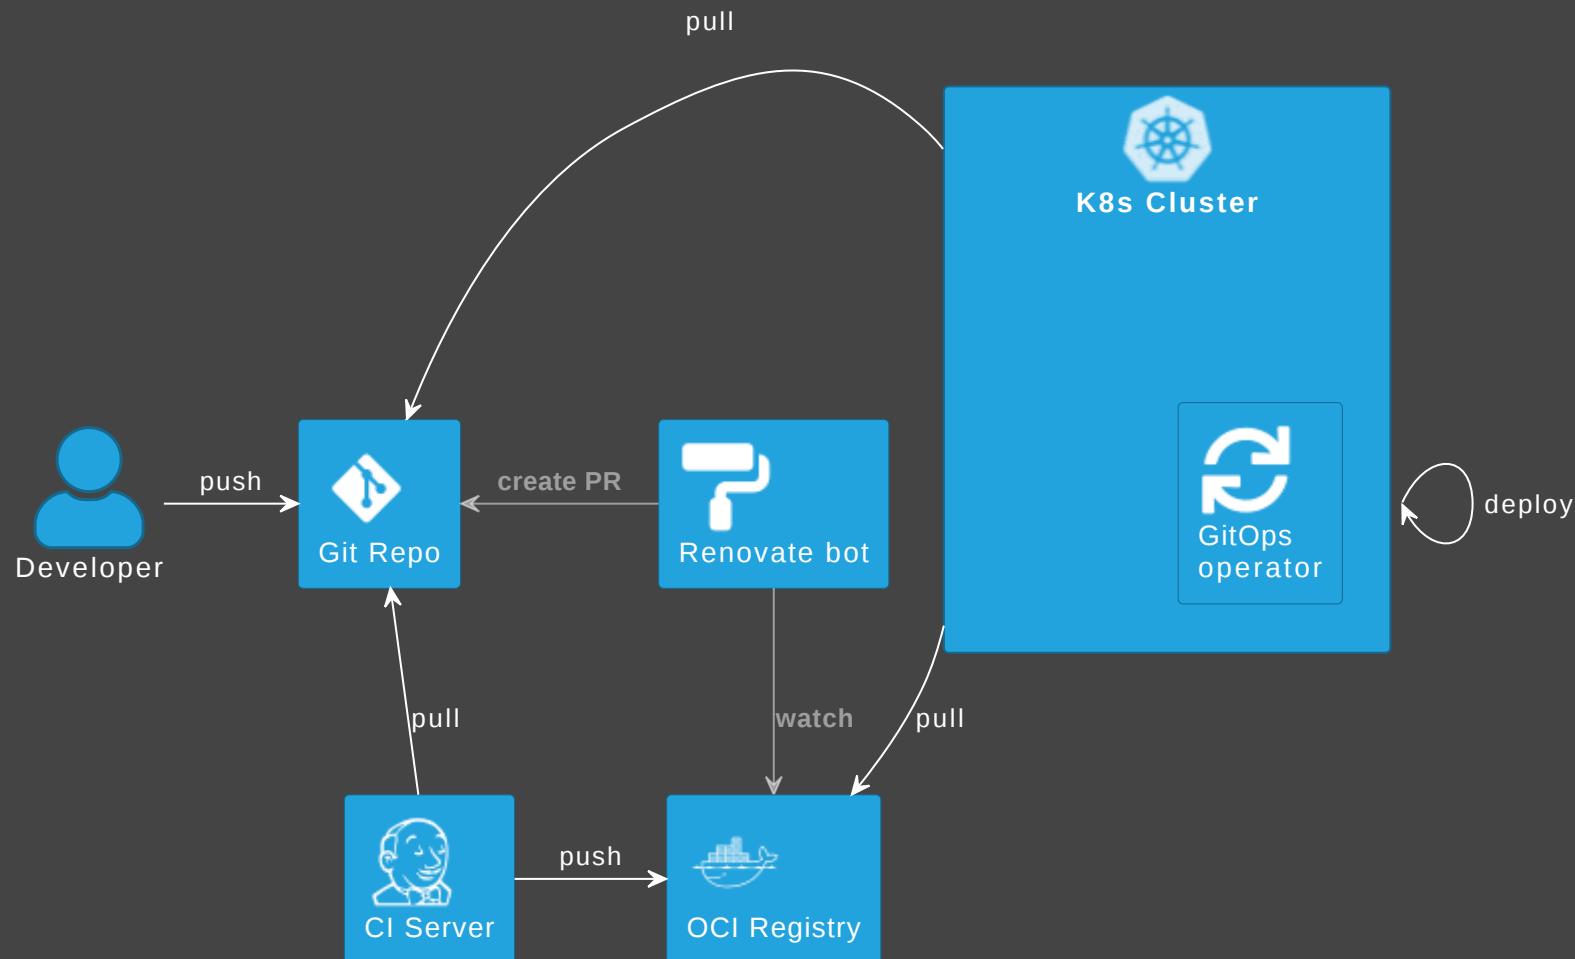

GitOps operator can update image version in Git

- 🐦 github.com/argoproj-labs/argocd-image-updater
- ⚙️ fluxcd.io/docs/guides/image-update

Using CI-Server with GitOps part 2

Stage promotion using renovate bot

As example: Our approach

- Repo pattern:

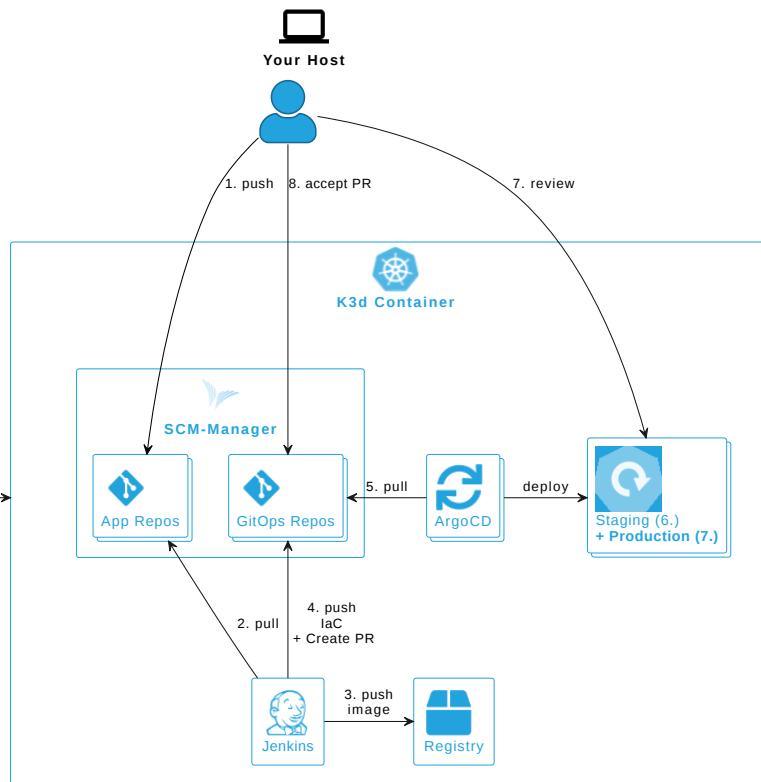

Trunk-based repo per team, folder per stage+app

```
└── staging
    └── application
        └── deployment.yaml
└── production
    └── application
        └── deployment.yaml
```

- Promotion between stages:
 - commit to staging folder only (💡 protect production),
 - create short lived branches and pull requests for prod
- IaC either
 - lives in app repo and is pushed by CI-Server or
 - in GitOps repo (3rd party apps).

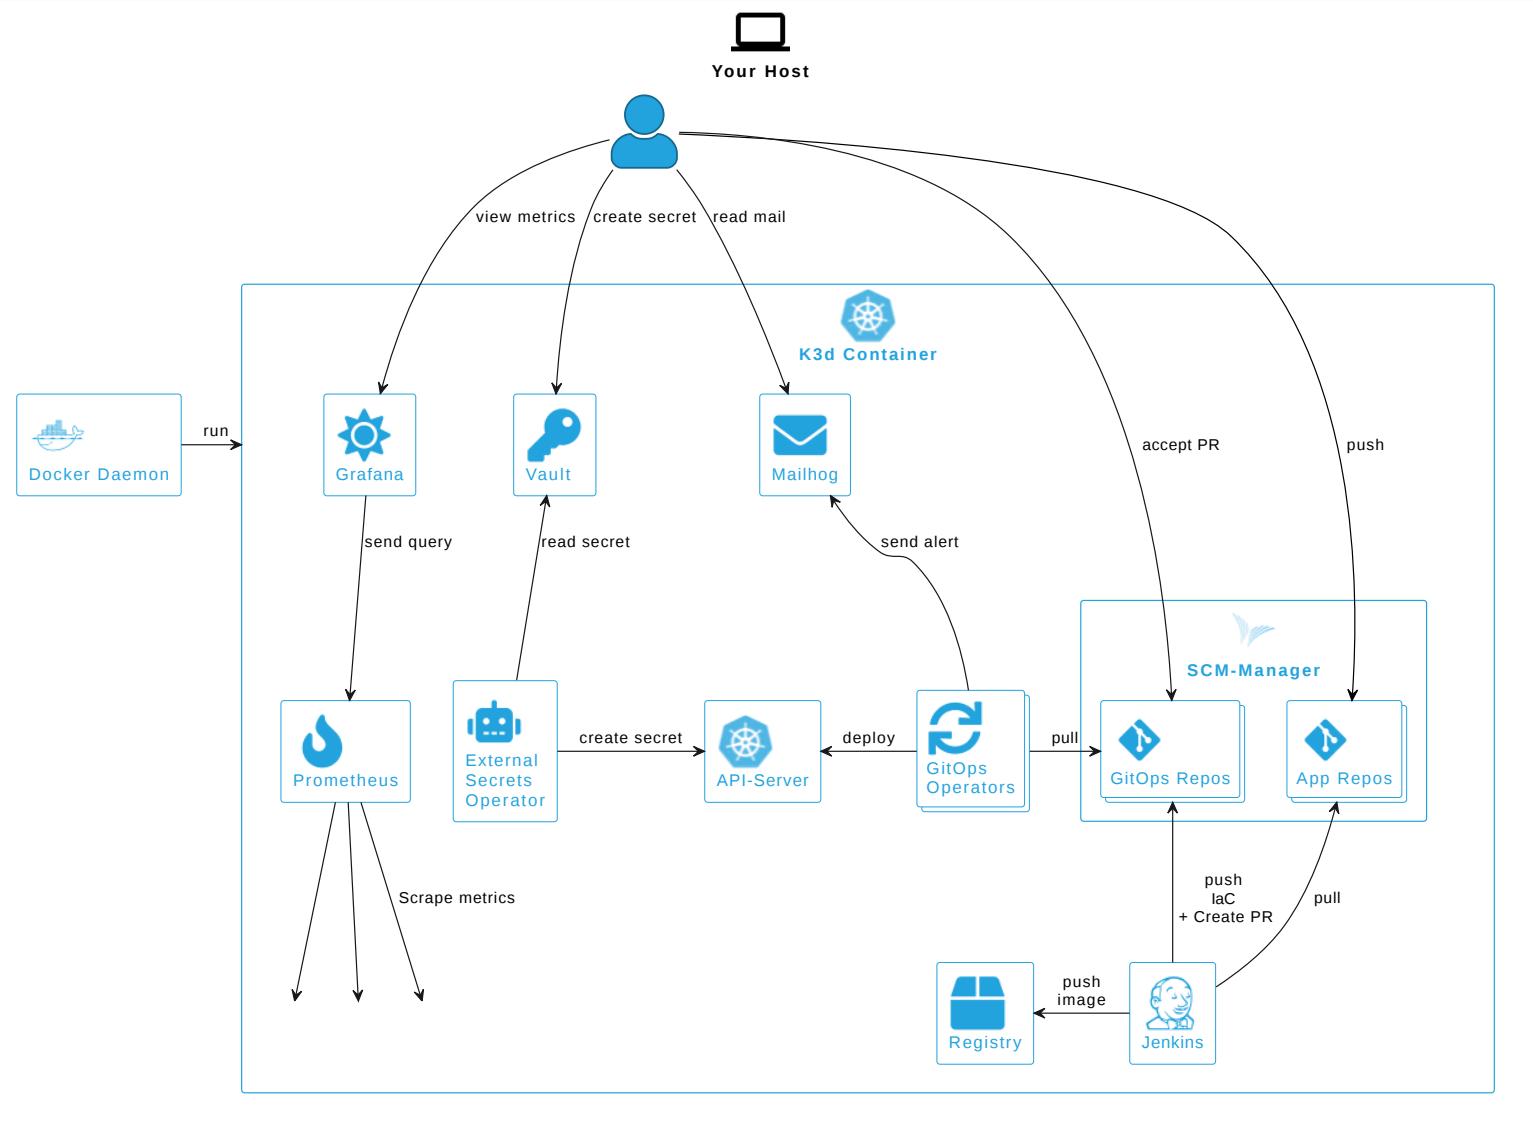

Demo

BTW: More Features to explore

Is GitOps something for me?

- + Has advantages, once established
- Don't underestimate learning curve and migrations
