

# // INTRODUCTION TO GITOPS – A NEW AGE OF AUTOMATION?

Johannes Schnatterer, Cloudogu GmbH

 @jschnatterer

Version: 202104221750-a9dd14a

# Agenda

- What is GitOps?
- Where can it be used?
- How can it be used?
- What challenges arise?

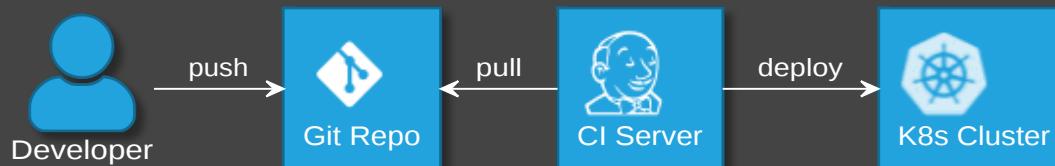

# What is GitOps?

- Operating model
- Term (August 2017):

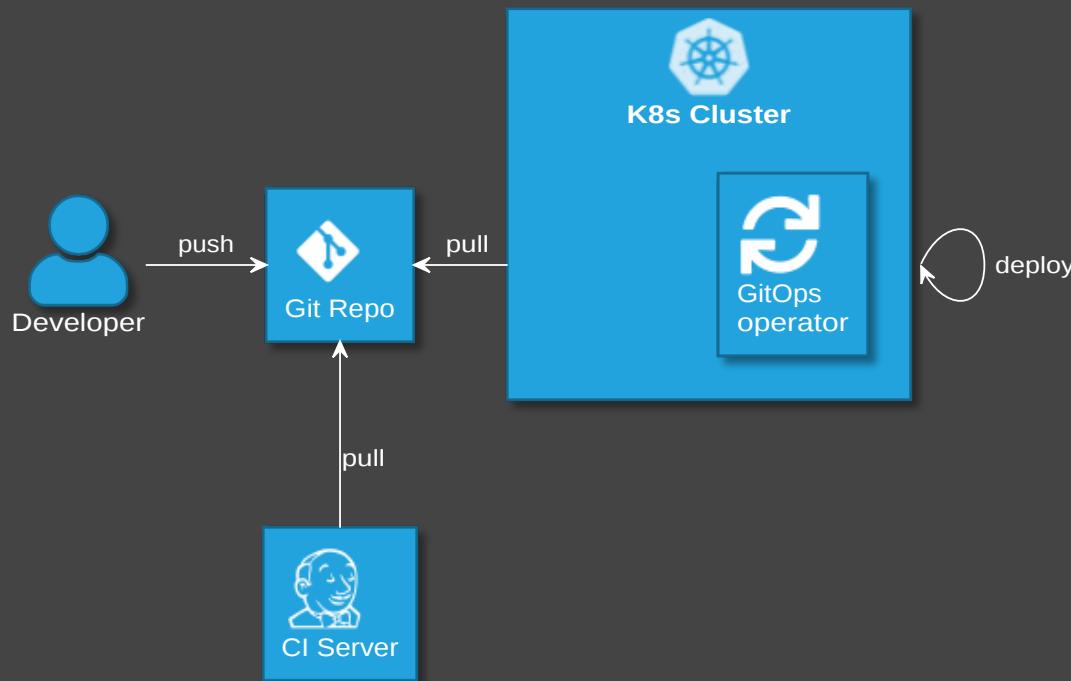

Use developer tooling to drive operations

 [weave.works/blog/gitops-operations-by-pull-request](https://weave.works/blog/gitops-operations-by-pull-request)

# "Classic" Continuous Delivery ("CIOps")

# GitOps

# GitOps Principles

- 1 The principle of declarative desired state
- 2 The principle of immutable desired state versions
- 3 The principle of state reconciliation
- 4 The principle of operations through declaration

沩 WIP!

# GitOps vs DevOps

- DevOps is about collaboration of formerly separate groups (mindset)
- GitOps focuses on ops (operations model)
- GitOps can be used with or without DevOps

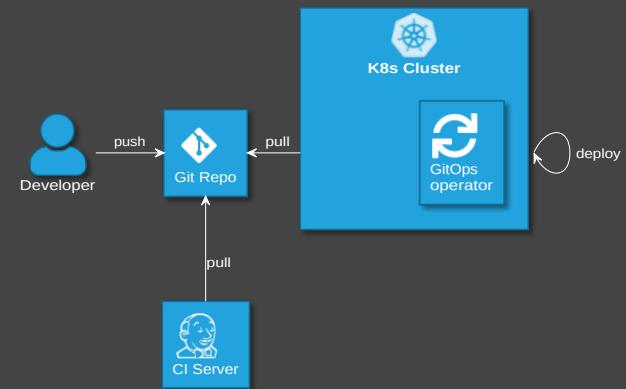

# "The right way to do DevOps" (Alexis Richardson)

# Advantages of GitOps

- (Almost) no access to cluster from outside
- No credentials on CI server
- Forces 100% declarative description
  - auditable
  - automatic sync of cluster and git
- Enterprise: Accessing git is simpler  
(no new firewall rules)

A photograph of a blue claw hammer resting on a light-colored wooden surface. Several metal nails are scattered around the hammer, some partially driven into the wood. The lighting is dramatic, highlighting the texture of the wood and the metallic surfaces.

# What can GitOps be used for?

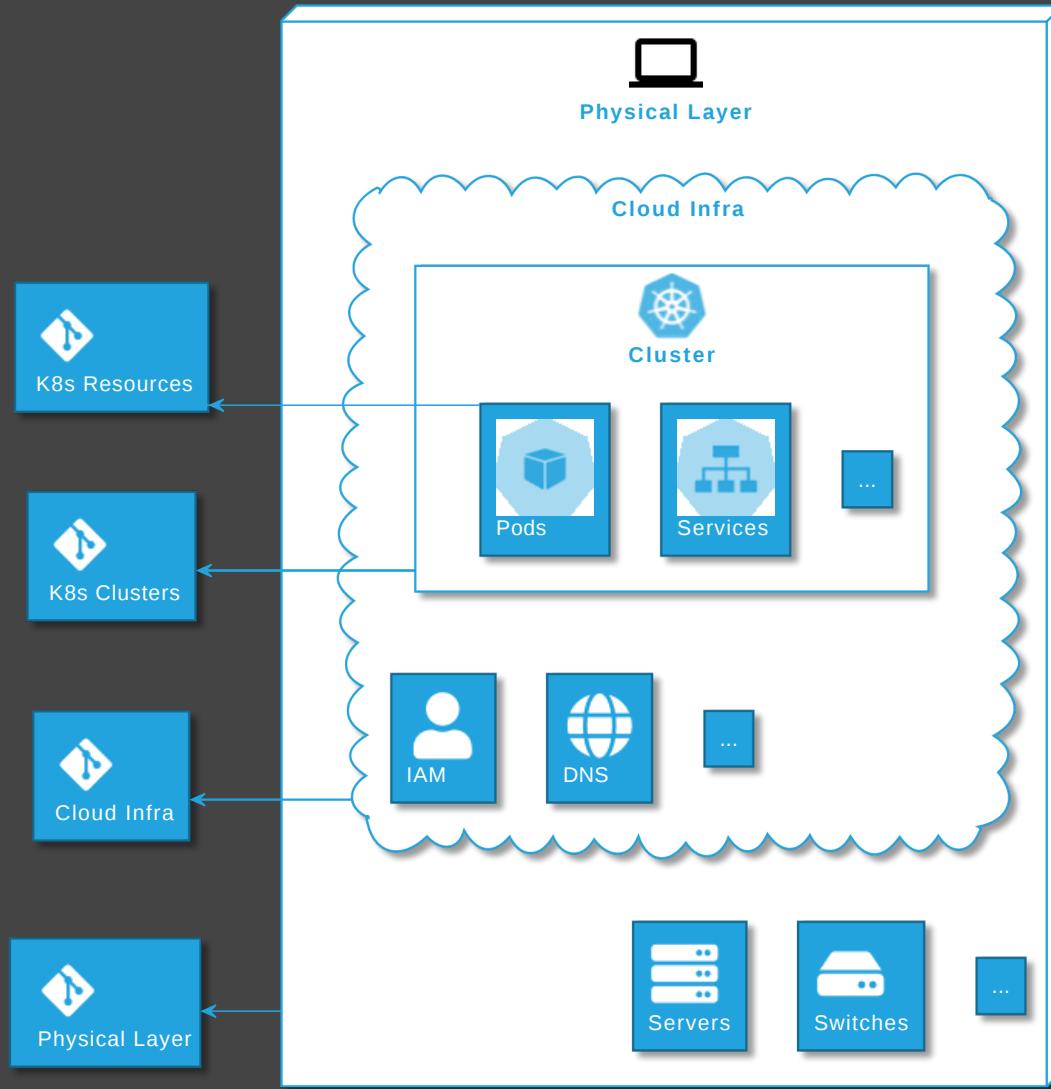

## GitOps History in a nutshell

- grew up operating applications on Kubernetes,
- is now rising above it, operating clusters and other (cloud) infrastructure

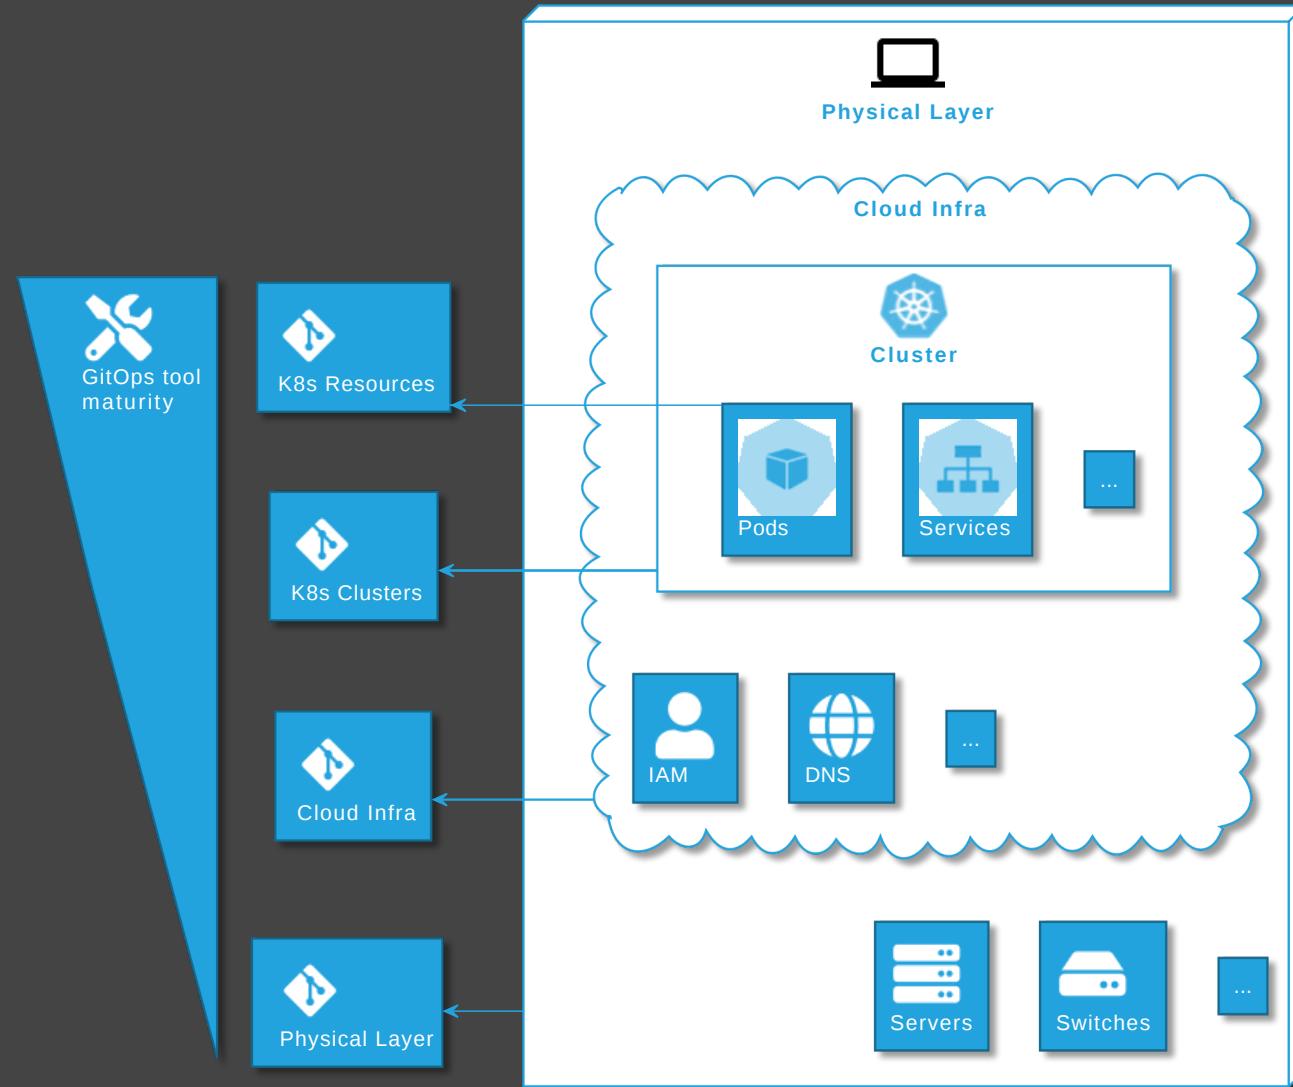

More on the history of GitOps:

# **How can GitOps be used? Design Decisions**

- Implementing stages
- Role of CI server
- Number of Repos
- ...

# Implementing stages

## Idea 1: Staging Branches

- Develop → Staging
- Main → Production

Logic for branching complicated and error prone (merges)

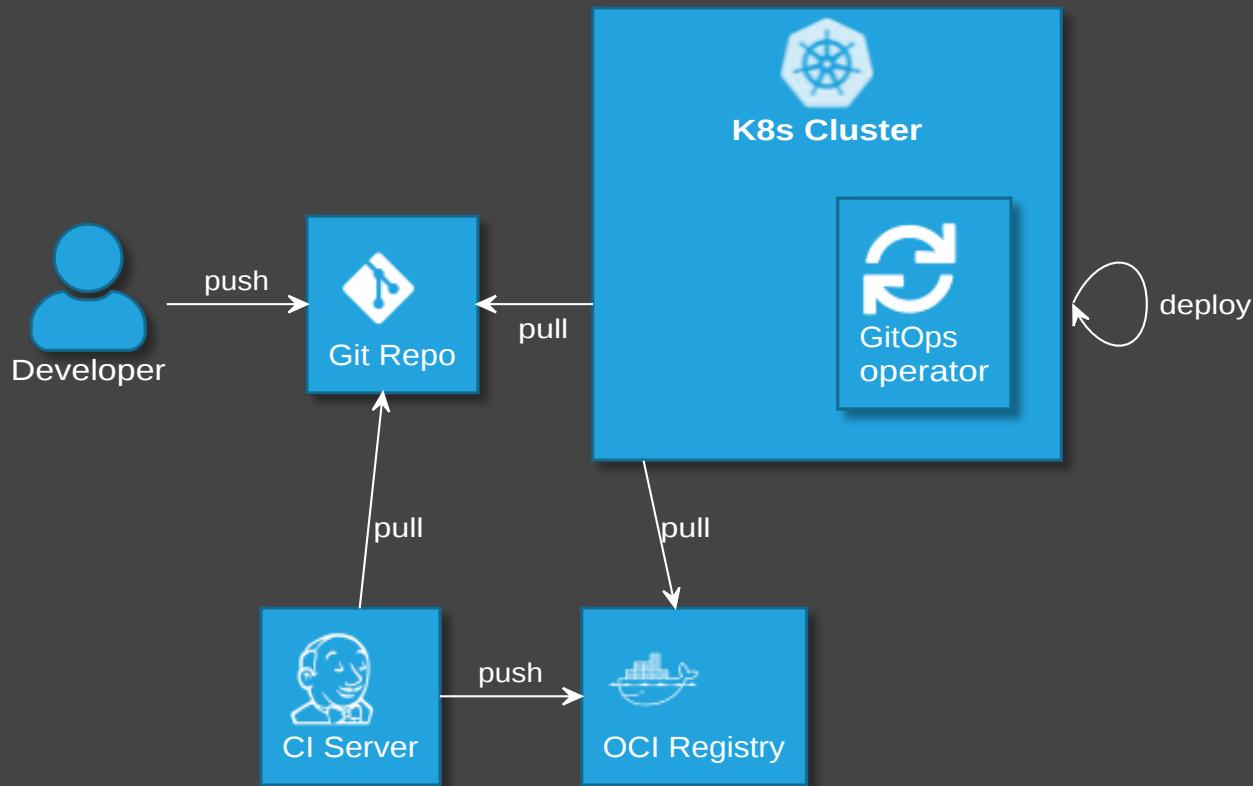

## Idea 2: Staging folders

- On the same branch: One folder per stage
- Explicit namespace in resource YAMLs, if necessary
- Process: Just commit to staging folder, create PRs for prod
- Risky, but can be automated

- Logic for branching simpler
- Supports arbitrary number of stages

# Role of CI server

## **Application repo vs GitOps repo**

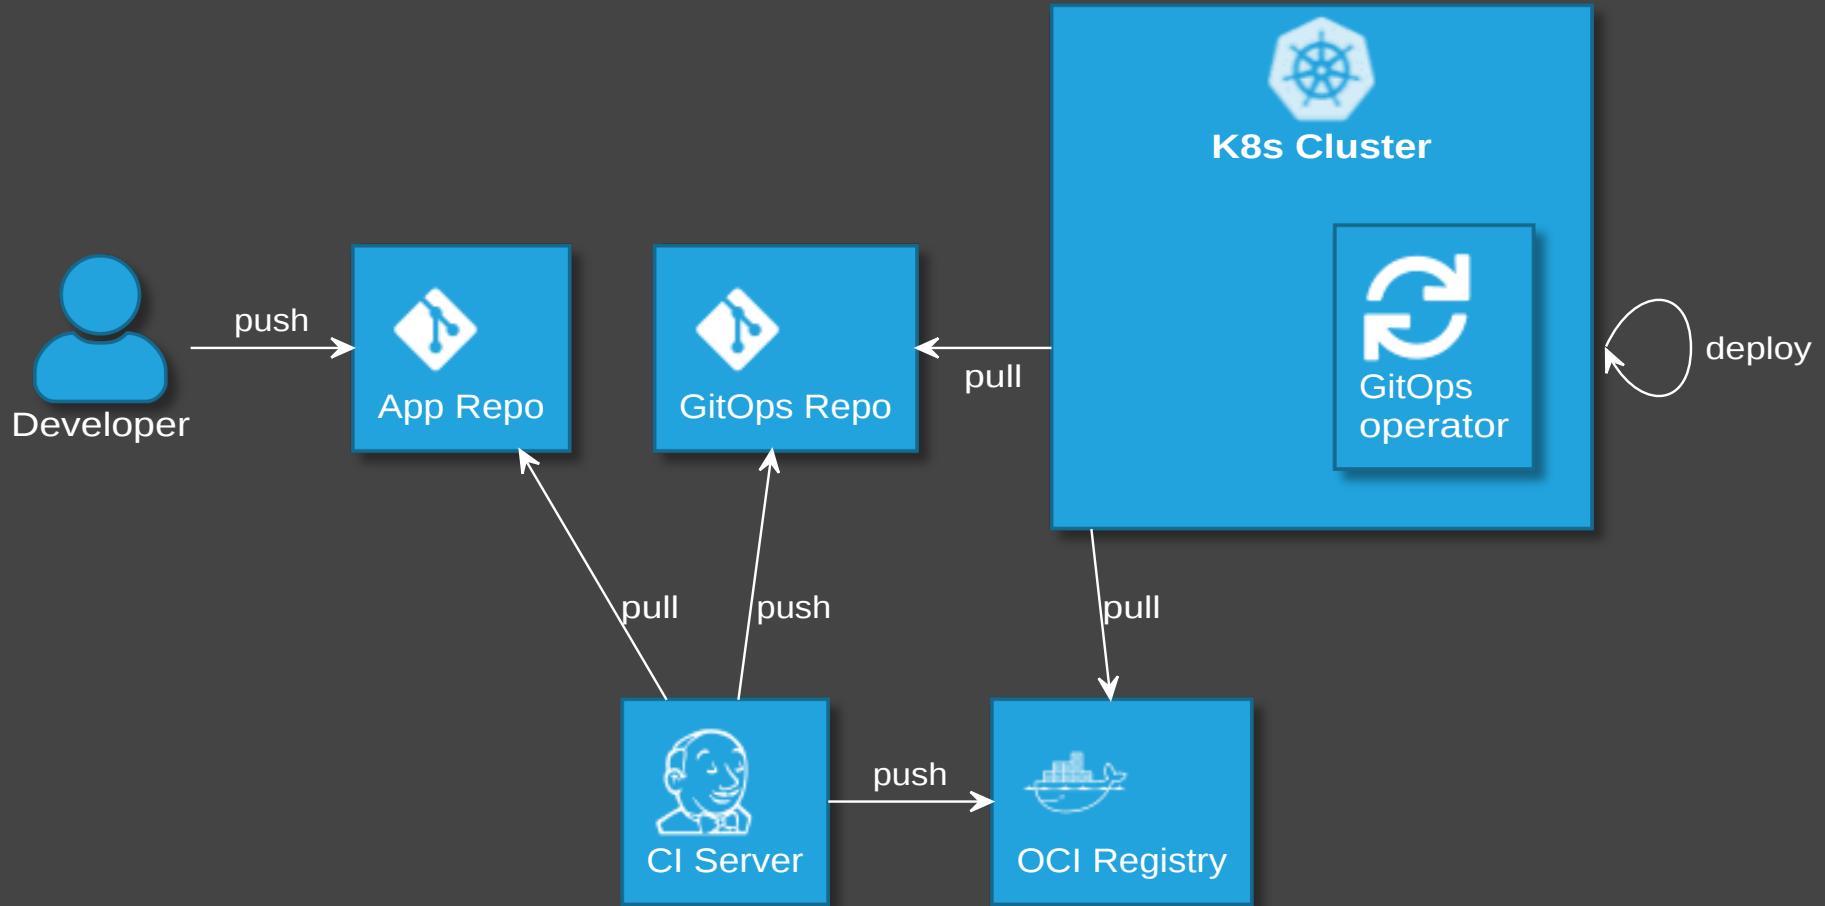

- Good practice: Keeping everything in app repo (code, docs, infra)
- GitOps: Put infra in separate repo?

Disadvantages:

- Separated maintenance
- Separated versioning
- Review spans across multiple repos
- Local dev more difficult

**Can't we have both?**

# Yes, we can! Using a CI-Server

## Disadvantages

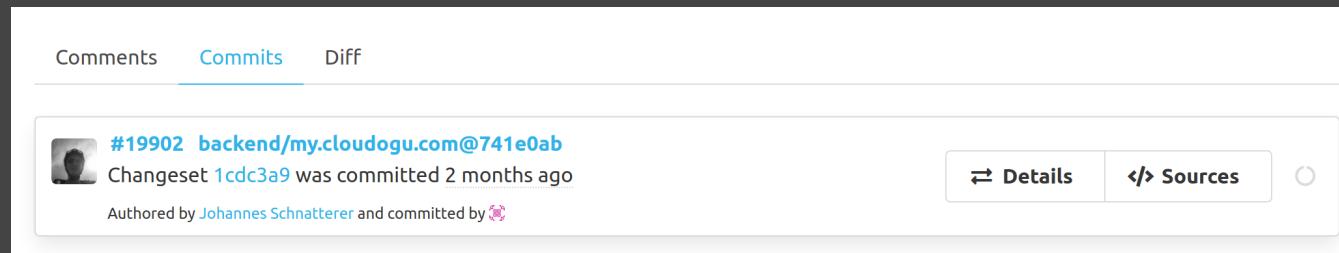

- Complexity
- Efforts for developing CI pipelines
- A lot can go wrong. Examples
  - Git Conflicts caused by concurrency
  - Danger of inconsistencies

→ Recommendation: Use a plugin or library

Example:  [clodogu/gitops-build-lib](#) 

# Advantages

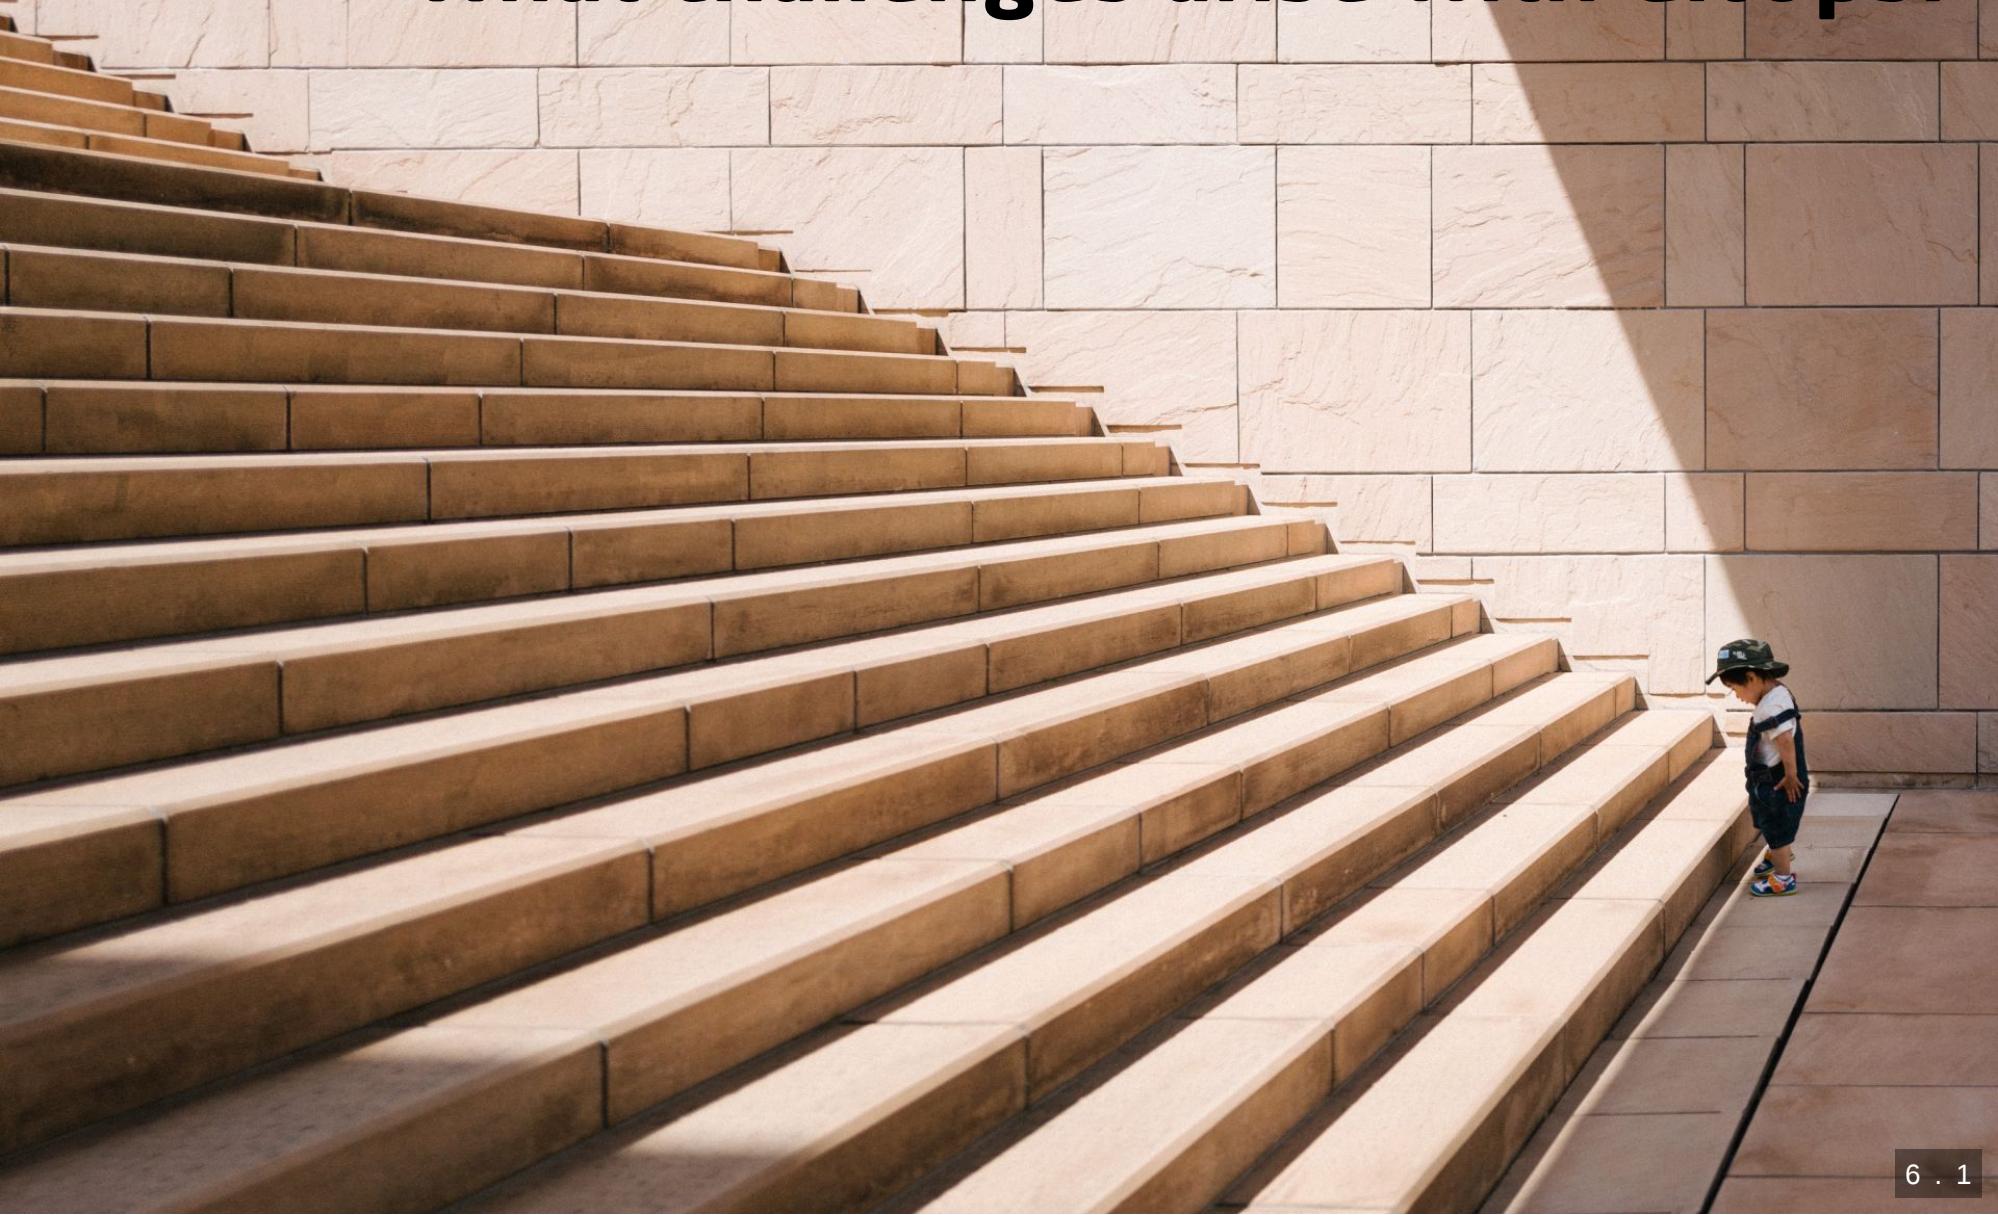

- Fail early: static YAML analysis on CI server,  
e.g. yamlint, kubeval, helm lint
- Automated staging (e.g. PR creation, namespaces)
- Use IaC for development environment
- Write config files not inline YAML
  - Automatically converted to configMap
- Simplify review by adding info to PRs

# Demo

 [cloudogu/k8s-gitops-playground](#)

# **What challenges arise with GitOps?**

## More Infra ...

- GitOps Operator: One or more custom controllers
- Helm, Kustomize Controllers
- Operators for Supplementary tools (secrets, etc.)
- Monitoring/Alerting systems
- ...

## ... higher cost

- Error handling
  - failing late and silently
  - monitoring/alerting required
  - reason might be difficult to pinpoint
  - operators cause alerts (OOM errors, on Git/API server down, etc.)
- Resource consumption
- Maintenance/patching
- Vendor support necessary

# Day two questions

- POC is simple
- Operations in prod has its challenges
  - How to structure repos?
  - How to realize staging?
  - How to delete resources?
  - How to realize local dev env?
  - ...

# How to delete resources?

- “garbage collection” (Flux) / “resource pruning” (ArgoCD)  
disabled by default
-  Enable from the start → avoid manual interaction

# Local development

- Option 1: Deploy GitOps operator and Git server on local cluster
  - ➡ complicated
- Option 2: Just carry on without GitOps. Possible when IaC remains in app repo

# CONCLUSION

# Personal Conclusion

After migrating to and operating with GitOps in production for > 1 year

- Smoother CI/CD,
  - *everything* declarative
  - faster deployment
  - force sync desired state  actual state
- But: security advantages only when finished migration
- A lot of potential ahead!

# GitOps experience distilled

- + Has advantages, once established
- Mileage for getting there may vary

# Adopt?

- Greenfield
  - Kubernetes AppOps: Definitely
  - Cloud Infra: Depends
- Brownfield: Depends

## Techniques

### GitOps

Published: Apr 13, 2021

APR  
2021

**HOLD** ?

We suggest approaching **GitOps** with a degree of care, especially with regard to branching strategies. GitOps can be seen as a way of implementing **infrastructure as code** that involves continuously synchronizing and applying infrastructure code from **Git** into various environments. When used with a "branch per environment" infrastructure, changes are promoted from one environment to the next by merging code. While treating code as the single source of truth is clearly a sound approach, we're seeing branch per environment lead to environmental drift and eventually environment-specific configs as code merges become problematic or even stop entirely. This is very similar to what we've seen in the past with long-lived branches with **GitFlow**.
